

IHS Rushmore Shale Performance Review (SPR)

World's leading community of peer-to-peer benchmarking for global shale plays

In February 2012 a group of Operators assembled in Houston and agreed to share offset data on their shale wells. They developed a data set covering drilling, completions and frac'ing, containing the key technical, time and cost data that they would find most useful.

They did this because there is no other source of highly reliable and easily accessible offset shale data to meet their needs.

IHS Rushmore - World's leading community of peer-to-peer performance benchmarking

IHS Rushmore facilitates the Shale Performance Review (SPR) where Operators decide what data to share, the rules for sharing, yearly changes needed, and how additional value can be gained, while keeping their proprietary ownership of the data.

IHS Rushmore Shale Performance Review (SPR) is the world's leading facilitator of peer-to-peer performance benchmarking for multi-stage frac'ed wells with 28 Operators in 7 different countries analysing up to 80 individual data elements.

Operators have participated in the IHS Rushmore Shale Performance Review with data for over 13,000 wells drilled since 2011 helping them understand:

- Operational methods, efficiencies and cost
- Peer performance through external benchmarking
- Identification of best practices and costs
- Non-productive time (NPT) on drilling, completions and frac'ing and events contributing to capital expenditures
